PROJECTS

Automation Project
- Created a framework for an automation project for my previous employer to execute QA tests resulting in streamlined efficiency and improved accuracy
- This was created using Java with the Page-Object design pattern and SpringBoot while also utilizing Selenium and Appium, along with JUnit and Cucumber

Auto-Stock Trader (AST)
- I created a Discord bot that users were able to make request to containing different stock tickers
- The bot would then utilize an automated web scraping script that gathered data about the requested stocks
- Then would display that information, along with various calculations, in a spreadsheet and DM it to the requester
- Made using Python, utilizing Selenium, beautifulsoup, and other libraries

FantasyJS
- An app where users can search for NHL players and be shown data about their performance
- Uses various APIs to gather player data
- App returns a page containing different cards containing stats and graphs about the player and their team
- Built using React and Javascript

Personal Portfolio

- Fully responsive website showcasing me and my experience
- Responsiveness achieved using Flexbox for some portions and Bootstrap for others
- Built using HTML, CSS, Flexbox, and Bootstrap
